

HACKATHON DEMO

Spot risk before treatment is delayed.

Sanitas helps hospitals see which medicines are exposed, why the risk exists, and what the supply team should check next.

WHY IT MATTERS

Shortages hit late.

Hospitals often see the problem when ordering gets hard. By then, oncology teams may already be planning substitutions, rationing, or delays.

Patients depend on steady supply

For the demo, the patient story centers on a cancer medicine.

Risk starts upstream

Suppliers, ingredients, quality events, logistics, and market signals all matter.

WHAT WE BUILT

A live map of medicine supply risk.

- Overview of medicines the hospital manages.
- Graph of ingredients, suppliers, manufacturers, places, events, and sources.
- Risk scores that make one action path stand out.

ONE CLEAR PATH

Cisplatin Injection is the medicine we click.

MEDICINE**Cisplatin
Injection****SIGNAL****FDA current
shortage****SUPPLIER****Accord / Intas****CONSTRAINT****GMP compliance**

OTHER RISKS STAY VISIBLE AS CONTEXT

ONE PATH NEEDS ACTION

INVESTIGATE

The agent checks the evidence.

It reads the mapped graph, searches for one newer source, adds it as supporting evidence, and prepares report context.

Tool calls are visible

The demo shows the investigation steps instead of hiding them.

Report ready

The output is prepared for the hospital team, not auto-approved.

DECISION BRIEF

Short report. Clear action.

ACTION NEEDED

Prepare alternate supplier order. Verify approved supplier availability and lead time before stock falls below safety threshold.

With six months, we would connect live data streams, expand the graph, and test it with hospital supply teams.
