

Cisplatin Injection Supply Risk Brief

Prepared from mapped evidence
Demo report preview

Active shortage evidence and a supplier quality constraint create a high-risk path for hospital-ready cisplatin supply.

Cisplatin is a platinum chemotherapy medicine. Delays can force oncology teams to ration, delay, or substitute treatment, so supply teams need early warning before Medicine Availability reaches the safety threshold.

RECOMMENDED ACTION

Prepare alternate supplier order

Verify approved supplier availability and lead time before stock falls below safety threshold.

RISK PATH

MEDICINE Cisplatin Injection	PRIMARY SIGNAL FDA current shortage	SUPPLIER PATH Accord / Intas	CONSTRAINT GMP compliance requirement
--	---	--	---

EVIDENCE PRIORITY

PRIMARY FDA Cisplatin Injection shortage record Current shortage status and supplier-level reasons anchor the action path.	CLINICAL ASHP Cisplatin Injection shortage detail Clinical pharmacy context supports hospital relevance and usual-ordering risk.	SUPPORTING Times of India API report, May 2026 Recent upstream API-risk signal, useful context but not primary U.S. proof.
--	--	--

OPERATIONAL CHECKLIST

- Check approved alternate suppliers.
- Confirm lead times for usable presentations.
- Review current stock and safety threshold.
- Escalate oncology allocation policy only if inventory drops.

CONFIDENCE AND CAVEATS

- Confidence is high because FDA and ASHP are primary shortage sources.
- API and platinum-market signals increase confidence in upstream fragility.
- Patient impact is narration only and not represented as patient-level data.
- Upstream signals are risk amplifiers, not the direct proven cause.

This report preview is an operational supply-risk brief. It does not make a procurement, formulary, or clinical treatment decision.
